I. OFFSHORE DRILLING: A DOUBLE-EDGED SWORD

For the first time ever, America’s oil and gas industries are outsproducing Russia’s.¹ Saudi Arabia remains the world’s largest producer of oil; however, America is now the second major player.² This increase in production is due to new technologies in the areas of both hydraulic fracturing and offshore drilling.³ The offshore drilling industry is expanding and will probably continue to expand due to all the untapped land under oceans.⁴ American dependence on oil is not likely to wane anytime soon, but “[t]he U.S. cannot achieve oil independence from land-based resources alone, and thus feels pressure to drill deep in the ocean where there are promising large oil reserves, despite the technological difficulties.”⁵ Americans need oil on a daily basis, but the oil companies’ practices often give rise to backlash from environmentalists and government protection agencies; offshore drilling is a double-edged sword.⁶

On April 20, 2010, a British Petroleum (BP) offshore drilling unit known as Deepwater Horizon exploded in the Gulf of Mexico, releasing roughly five million barrels of oil into the ocean.⁷ The explosion and spill

⁵. Hari M. Osofsky, Multidimensional Governance and the BP Deepwater Horizon Oil Spill, 63 FLA. L. REV. 1077, 1083 (2011); Eastment & White, supra note 2, at 6 (“Energy lies at the intersection of national security, environmental protection, and economic health.”).
gave rise to public demand for government intervention to prevent similar disasters from occurring again in the future. The profits that oil companies stand to make are largely concentrated with the oil companies themselves, whereas the costs of spills “spread across a wide swath of society and the environment.” In response to the spill, on May 28, 2010, President Obama implemented a moratorium, or temporary suspension, on all offshore drilling. The moratorium and the safeguards that followed were controversial and initially caused financial setbacks for the entire American oil industry. Some of these problems continue to this day.

_8._ See _Brogdon_, _supra_ note 4, at 297. _But see_ _Brogdon_, _supra_ note 4, at 309 (explaining how when oil industry accidents occur, “regulators are under no statutory obligation to modify their procedures in light of problems revealed by the accident”).

Since taking office January 20, 2017, President Donald Trump has attempted to reverse some of the environmental regulations that were put into place during the Obama administration. Ben Lefebvre, _Oil and Gas Allies to Trump: Slow Down_, POLITICO (Aug. 25, 2017, 5:11 AM), https://perma.cc/P76K-8AUM. This article was written pre-Trump and focuses on actions taken by the Obama administration after Deepwater Horizon.
This article focuses on how government-implemented edicts can abruptly and adversely affect myriad companies and even lead some into bankruptcy.13 The implementation of moratoria and the discretion used in issuing them can create new and challenging problems. Part II discusses how the moratorium following the spill was implemented, as well as an overview of the economic nightmare that the moratorium caused for both Gulf Coast areas and the offshore drilling industry.14 Part III addresses the first lawsuit that questioned the legitimacy of the moratorium.15 Part IV focuses on how the moratorium and its aftermath forced Seahawk Drilling and ATP Oil & Gas into bankruptcy and analyzes the lasting effects of the moratorium on these two major offshore drilling companies.16 Part V examines what changes, if any, have been made to the offshore drilling industry since the spill and subsequent moratorium.17 Part VI addresses how other moratoria have been utilized in the past, both in the offshore drilling arena and in other industries.18 Finally, Part VII provides three recommendations concerning the use of moratoria in the United States.19 Included in this section is a brief discussion of how the industry may have suffered less if the moratorium had merely been applied to BP’s operations. This is followed by two additional recommended changes for government-implemented moratoria.

II. THE IMPLEMENTATION OF THE OFFSHORE DRILLING MORATORIUM

Over the years, presidents and Congress have had differing opinions concerning drilling for oil, but one consistency is the idea that the Department of the Interior (DOI) is tasked with considering the possible detrimental consequences when dealing with leases to drill wells.20 After the explosion, former Secretary of the DOI, Kenneth Salazar, submitted a report to President Obama conveying his approval of a moratorium on

14. See infra Part II.

18. See infra Part VI.
19. See infra Part VII.
offshore drilling, and Obama directed Salazar to stop all drilling on the Outer Continental Shelf for six months. In total, the moratorium put a stop to thirty-three rigs. But one of the biggest problems was that even after the moratorium was lifted, the government continued to treat the offshore drilling companies as though the moratorium were still in effect.

In reference to the harm that the lack of permits caused, Louisiana Senator Mary Landrieu stated, “I have repeatedly said that the administration’s excruciatingly slow release of oil and gas permits will cause job losses . . . . How many more rigs have to leave and how many more businesses have to close before it realizes the havoc the de facto moratorium is wreaking on the Gulf Coast?” From 2008 to 2011, it was estimated that the Gulf Coast states lost 60,000 jobs because of the moratorium, which would not allow any new drilling permits in the area. Three months after the spill, the deepwater permits had fallen “71[%] from their historical monthly average of 5.8 permits per month.” By July 2011, the new average was 1.7 new permits per month.

27. Id.
spill, only eleven deepwater permits had been issued.28 The House of Representatives passed a bill on May 11, 2011, which required the Secretary of Interior to make a decision on every deepwater application within thirty days of its filing.29 The people of the Gulf region, including all of the employees who lost their jobs, viewed this “de facto moratorium” as a punishment to the entire Gulf region.30

One of the biggest hindrances offshore companies faced after the ban was lifted was the new requirement of proving that the company could contain a spill should it occur.31 This requirement tasked companies with supplying specific data about their plans of preparedness in order to receive a permit—information that none of the companies had ever prepared. Only upon successfully proving that they could contain an oil spill could companies apply for a permit.32 Exxon Mobil Corporation was the first company to create and have its plan approved to receive a permit for its lease.33 In response to the moratorium and the financial problems it caused, several dozen companies filed suit against Salazar, which led to a court-ordered lifting of the moratorium.34

III. BANNING THE MORATORIUM: HORNECK OFFSHORE SERVICES LLC V. SALAZAR

The DOI is in charge of offshore rig leasing, but its decision-making is subject to judicial scrutiny. In the first lawsuit filed in an attempt to lift the ban, Hornbeck Offshore argued that the government’s issuing of a moratorium was “arbitrary, capricious, [and] an abuse of discretion.” Hornbeck sought an injunction to ban the enforcement of the moratorium because it was interfering with and detrimentally affecting the offshore oil industry’s business. A district court enjoined the enforcement of the ban, and on June 22, 2010, it lifted the moratorium. Judge Feldman stated, “[T]he blanket moratorium, with no parameters, seems to assume that because one rig failed and although no one yet fully knows why, all companies and rigs drilling new wells over 500 feet also universally present an imminent danger.”

The DOI appealed the injunction to the Fifth Circuit Court of Appeals. The government requested to stay the decision to enjoin the ban, but a three-judge panel denied the request. In response to the Fifth Circuit’s ruling, Representative Pete Olson from the 22nd District of Texas stated that such a “blanket moratorium” harms the economy and negatively impacts the energy supply. He “urge[d] the Administration to take this latest ruling to heart and forgo any additional attempts to decimate the deep water offshore drilling industry.”

Obama issued a second moratorium, which was promptly challenged. In a Policy Brief concerning judicial oversight, Kyle G. Bates described that “[b]y replacing the May 20th moratorium with a practically identical one, and then testifying in an open Senate hearing that the moratorium was still

in effect, Salazar expressed clear intent to frustrate the court’s ability to meaningfully rule on the merits by allowing the injury to continue.”45 The second ban was lifted before its validity was decided.46 Even though the outcome was a win for offshore drilling companies, the moratorium left severe damage in its wake. Arguably, two of the biggest offshore drilling companies at the time, Seahawk Drilling and ATP Oil & Gas, suffered the worst damage.47

IV. THE LASTING EFFECTS OF THE MORATORIUM ON OFFSHORE OIL COMPANIES: SEAHAWK DRILLING AND ATP OIL & GAS

“Pursuant to the Bankruptcy Code (specifically including, but not limited to, 11 U.S.C. § 362), a debtor is afforded certain protection against its creditors.”48 Seahawk Drilling and ATP Oil & Gas, two Houston-based companies, filed for protection against their creditors, both blaming the moratorium for their bankruptcies.49 Seahawk Drilling was the first offshore drilling company to file for Chapter 11 bankruptcy.50 The Minerals Management Service (MMS) found that the moratorium would, in fact, last longer than six months, which would be injurious to the industry since it is an industry that relies on equipment and leases that are

Salazar Erroneously Decided?, 18 HASTINGS W.-NW. J. ENV’T’L. & POL’Y 407, 424 (2012) (explaining how “the collateral consequences of the first moratorium extend not only to the plaintiff drilling companies, but also to all members of the public, both directly and indirectly affected”).
50. See Carey, supra note 24.
only useful for a limited amount of time.\textsuperscript{51} The shortage of drilling permits led to ATP’s loss of business.\textsuperscript{52}

Former Seahawk CEO Randy Stilley stated, “The decision by regulators to arbitrarily construct unnecessary barriers to obtaining permits they had traditionally authorized has had an adverse impact not only on Seahawk, but on the sector as a whole.”\textsuperscript{53} After filing for bankruptcy protection, Seahawk sold nearly all of its assets to Hercules Offshore, Inc. for $105 million.\textsuperscript{54} Because of the massive asset sale to Hercules, Seahawk continued to serve its customers and function without interruption.\textsuperscript{55}

ATP resumed drilling in the Gulf of Mexico in the spring of 2012, but it lost so much money that it could not recover during the interim between the spill and the time in which it could begin to drill again.\textsuperscript{56} Paul Bulmahn, founder and chairman of ATP, blamed the Obama Administration’s “illegal ban” for his company’s implosion.\textsuperscript{57} Because of the ban on drilling, money stopped coming in, but ATP still had all of its expenses to pay, such as rig contracts and interest payments.\textsuperscript{58} ATP’s net loss in 2010 was $349 million.\textsuperscript{59} In 2012, ATP had $3.64 billion in assets and $3.49 billion in liabilities.\textsuperscript{60} Since ATP had a heavy rig concentration in the Gulf of Mexico, the impact of the moratorium was devastating.\textsuperscript{61}

\end{itemize}
On June 14, 2012, ATP brought a suit against the United States in the U.S. Court of Federal Claims. ATP’s claims arose from contracts with the U.S., as it acted through the DOI, MMS, Bureau of Ocean Energy Management (BOEMRE), Salazar, and Michael Bromwich, the former Director of BOEMRE. ATP alleged that when the DOI suspended all offshore drilling activities, it breached the active oil and gas leases that the DOI had previously issued to ATP. The complaint alleged that ATP relied on the leases, and thereby suffered significant damages (in excess of $68 million), including the termination of rig contracts, increased costs, and delayed production, as a direct result of the breach.

On August 17, 2012, ATP also filed for Chapter 11 bankruptcy protection. Prior to the ban, ATP spent $800 million on a Gulf of Mexico production platform, which was ready to begin production in 2010, but the ban unfortunately forced ATP to stop its project. Still, after the ban was lifted, ATP was unable to produce oil from its six wells in the Gulf of Mexico. The exploitation of those wells would have greatly increased ATP’s shareholder value and income and would have prevented ATP from filing for bankruptcy. In an official statement, the company noted, “In addition, these incremental cash flows would have mitigated or prevented the need to enter into many of the financings ATP has closed since the imposition of the moratoria—financings that require relatively high rates of return and monthly payments.”

During the six months the moratorium was in effect, significant changes were made to the offshore drilling industry. The following section provides an overview of the status of the offshore drilling industry for the rest of Obama’s tenure, and how it might have been different had the oil spill at Deepwater Horizon never occurred.

V. OFFSHORE DRILLING AFTER DEEPWATER HORIZON

There are obvious concerns about whether offshore oil can be procured in a manner that is safe for the environment. The moratorium that was enacted as an emergency response to one of the worst oil spills in the history of drilling has proven to be extremely controversial. Further, there are no laws in place to stop the government from implementing additional bans on the offshore drilling industry, as well as on other industries, in the future. The oil spill was a horrible accident, environmentally and economically, but the implementation of a six-month moratorium was not fruitful. In the months that followed the spill, President Obama cited concerns about future oil spills in the Gulf of Mexico and used the opportunity to publicly scold BP, but in effect, the entire offshore drilling industry, as well as the American economy, was harmed.

The industry has evolved since the spill, but the moratorium itself had little effect on improving industry practices and is viewed by some critics today as more of a political move by the Obama administration. In her article, A New Horizon?: The Need for Improved Regulation of Deepwater Drilling, Lauren Hunt Brogdon adds, “Unfortunately, appropriately protective regulations directed at the oil industry are usually only implemented after a high-profile accident inflicts catastrophic and

72. See generally Kathryn A. Watts, Regulatory Moratoria, 61 DUKE L.J. 1883 (2012) (explaining that issuing moratoria is a tool Presidents have in their presidential toolbox).

irreparable harm to human health, the environment, or the nation’s economy.”75 Changes have been made since the spill, but these modifications could have all been made with or without the moratorium.

A. The Spill Called into Question Longstanding MMS Shortcomings

In the United States, both the Coast Guard and the DOI monitor offshore drilling.76 Prior to the spill, the MMS—which polices the safety of offshore rigs—shared an office with the DOI’s oil leasing program.77 This situation created the potential for conflict.78 While the MMS and the DOI were working together, the MMS wanted more regulation and the DOI’s oil leasing program wanted less regulation.79 “Inspectors were routinely treated to golf tournaments, hunting trips, fishing expeditions, sporting tickets and other expensive ‘perks’ by the oil companies MMS was supposed to be regulating.”80 MMS had the dual task to both regulate and promote offshore drilling.81 After the spill, Obama divided the MMS into two divisions but kept Secretary Salazar in charge of both.82

A failing blowout preventer caused the Deepwater Horizon spill.83 Not surprisingly, the MMS had no “established minimum capabilities for blowout preventers or testing protocols.”84 Without fear of government

83. Bratspies, supra note 1, at 32.
84. Id.; READ, supra note 10, at 213 (“Various people have called into question whether this lack of oversight was in deference to expertise, due to incompetence or a too-cozy relationship between regulators and Big Oil, or the product of outright corruption of the regulatory process.”).
sanctions, there was little incentive for companies to spend money to develop absolutely safe technologies. Generally, the oil industry would rather invest in new extraction technologies than in safety, especially if it is not being forced to invest in safety.

Another key problem with the way the MMS oversaw potential leases was that after receiving a request for a drilling permit, the MMS was on a strict deadline, to the extent that it was required to determine whether a permit would be awarded within thirty days of the request date. The agency is forced by this artificially short deadline to make critical decisions on the basis of more-generic documents prepared for earlier stages of the leasing process, rather than on site-specific information prepared specifically with regard to the particular wells under consideration.

It became well-known to lessees in the industry that the MMS did not have an adequate amount of time to conduct a thorough investigation into the environmental impacts should the proposed rig leak.

There were major structural issues with the way offshore drilling was being regulated by the government. A lack of regulation can easily lead to environmentally risky behavior on the drilling front. Secretary Salazar thought that the Deepwater Horizon spill illuminated the need to evaluate whether safe drilling practices were being developed in order to deal with the unique challenges deepwater drilling poses. To that end, Salazar created a Safety Oversight Board which evaluated the effectiveness of the BOEMRE and found there were not enough BOEMRE engineers to review all of the Gulf of Mexico permit applications that were routinely being filed. There were only fifty-five inspectors to cover the roughly 3,000 offshore platforms subject to inspection in the gulf. Further, there was no formal system of regulations or even a handbook for the inspectors

of the platforms. 96 BOEMRE attempted to implement industry-wide safety regulations such as “a requirement to certify compliance with existing regulations, signed by the operator’s chief executive officer; submission of detailed information about blowout preventers in use; retention of blowout preventer records; [and] third-party verification of blowout preventer fitness.” 97 Although the efforts of BOEMRE were a step in the right direction, BOEMRE initially had problems carrying out adequate solutions while dealing with restructuring issues of its own. 98

Salazar also established the Ocean Energy Safety Advisory Committee as an advisory committee made up of engineering scientific experts who can provide guidance on improving the safety of offshore drilling and response to spills. 99 Also, the Bureau of Safety and Environmental Enforcement (BSEE) was formed after the MMS was reorganized post-spill. 100 The Director of the BSEE, Brian Salerno, stated that as of spring 2014, “25 of the 33 BP Deepwater Horizon Commission recommendations have been acted upon or are in the process of being addressed.” 101

B. A Failure to Pass New Legislation

The DOI has taken many steps to improve oversight of the offshore oil industry, but until the legislature passes new regulations, these steps are moot. 102 During the Obama administration, Congress proposed, but did not pass, measures to ensure that an event like the Deepwater Horizon oil spill never happens again. 103 California Representative George Miller

technical requirements. Instead, they pertained to liability for damages to humans, economies, and the environment. “While a public call for new legislation and corresponding legislative proposals immediately followed the Deepwater Horizon spill, no law directly addressing prevention of similar disasters was adopted.” Salazar recognized that the Deepwater Horizon oil spill underscored the need to reassess whether practices that were implemented for drilling operations in the past needed to be improved to account for different challenges that deepwater drilling poses. From the non-governmental side, the oil and gas industry began working on a comprehensive offshore operations review even before the Gulf of Mexico cleanup had been completed. Industry experts worked with regulators from the DOI to develop new recommendations for standards in the field.

Erik Milito is a director of upstream and industry operations at the American Petroleum Institute. He stated that one of the most important issues that needed to be addressed was how to more quickly respond to an oil leak. Containment companies that were established after the spill have new technologies for handling spills at the wellhead. After the spill, more than 100 of the American Petroleum Institute’s industry standards have been made into federal regulations. Further, the oil and gas industry created the Center for Offshore Safety (COS). The COS’s mission is to “work with independent third-party auditors and government regulators to create an industry-wide culture of continuous safety improvement.” It is unclear whether all of these changes would have occurred if it were not for the moratorium, but it seems more likely that they were in direct response to the spill and not in response to the moratorium.

VI. WHY MORATORIA?

In *Youngstown Sheet & Tube Co. v. Sawyer*, the United States Supreme Court held that only Congress, and not the president, had the power to take over steel production because steel production is directly related to commerce. It is the most important case regarding executive power limits. In 1952, President Truman signed Executive Order 10,340, which gave the federal government control of eighty percent of the steel mills. The order was an attempt to prevent the nation’s steelworkers from striking because they wanted an increase in wages, which could potentially morph into a national steelworker strike. By placing the steel mills under federal control, the President was also trying to ensure that there would be plenty of steel available for the war. 

Due to the national emergency at the time, President Truman felt as though the executive order was valid, but the Court disagreed; even such a state of emergency does not authorize presidents to sign such orders. *Youngstown* presents a slightly different issue than the offshore drilling moratorium because it concerned an executive order; the offshore drilling moratorium was an example of President Obama entrusting an agency head, Salazar, with the decision to put a halt to an entire industry with a moratorium, which President Obama then approved. Presidents always oversee how agencies perform their functions. Even though an executive order is administratively different than an agency-requested moratorium, the intended result of the executive order in *Youngstown* was similar to the outcome of the Deepwater moratorium, and the respective courts struck down both the executive order and the moratorium.

Moratoria have been used in many contexts. They are generally “used by administrative agencies as a common means to ‘preserve the status quo while formulating a more permanent . . . strategy.’”

133. *Id.*
moratorium was imposed in 2008 in an effort to improve the economy when many believed there was a national foreclosure crisis. The stock market fell by more than fifty percent, and because of the mortgage foreclosures, the housing market nearly imploded. After the Great Depression, foreclosure moratoria were enacted by either making the foreclosure process more complicated with the addition of steps or by forcing a judicial stay of foreclosure proceedings. The Federal National Mortgage Association and the Federal Home Loan Mortgage Corporation were companies sponsored by the government in an attempt to stabilize mortgage lending in the U.S. In 2008, after multiple accounting scandals, the Federal National Mortgage Association and the Federal Home Loan Mortgage Corporation were placed under the government’s control and were subjected to moratoria. The hope was that if there were a moratorium, there would be fewer foreclosures. Other major lending companies followed in suit with their own moratoria, which essentially led to the effect of a federal moratorium on lending.

A second example of an emergency moratorium occurred on the heels of the 2005 hurricane season. The McCarran-Ferguson Act empowers states to adopt emergency moratoriums. Various insurance departments in Alabama, Mississippi, Florida, and Louisiana implemented emergency regulations and moratorium statutes in an attempt to prevent market withdrawals. If any large insurance company were to pull out of the area, then the homeowner insurance marketplace would suffer locally. “By preventing market withdrawal, these states may potentially jeopardize the continued solvency and viability of regional and national insurance

companies, which may affect citizens of non-hurricane-affected states, and their respective state guaranty funds.”

Hurricane Andrew led to the bankruptcy of multiple insurance companies due to the policyholders’ claims exceeding the reinsurance that had been set aside for claims. These bankruptcies gave rise to insurance companies wanting to withdraw from southern Florida, but the Florida Department of Insurance issued an emergency moratorium on cancelling or not renewing homeowner policies for people residing in coastal counties. This state-imposed effort attempted to stabilize the marketplace for residential homeowner’s insurance after Hurricane Andrew.

Another moratorium was implemented during President George H.W. Bush’s presidency. A ten-year moratorium, through an Executive Order, was passed in order to prevent the exploration and development of oil and natural gas in the Outer Continental Shelf. President Clinton extended this moratorium, which was in place as an attempt to protect the coasts, for two more years. Some federal lands, like national parks or wilderness areas, have been set aside through congressional or presidential designations instead of through moratoria, but the effect is the same. “Moratoria imposed by Congress and the executive have at different times provided an important part of the legal backdrop to offshore oil development.” These are examples of moratoria that had finite goals in mind, but the implementation of the moratorium after Deepwater was not under the guise of the improvement of anything. The section that follows contains an analysis of why the government should have only implemented a moratorium on BP, rather than on the entire offshore drilling industry.

VII. A CHANGE IN THE WAY MORATORIA ARE USED

A. If There Had to be a Moratorium, Perhaps it Should Have Only Applied to BP

After the Deepwater spill, BP’s history of safety breaches was called into question. Historically, BP’s safety record is detestable, having been the cause of multiple high-profile incidents. BP has invested more money than any other company into drilling in the Gulf of Mexico, but of all the oil companies, it has the worst safety record. BP currently holds more leases in the Gulf of Mexico than any other company.

In the past, BP caused many disasters. In 1988, 167 people died when the Piper Alpha rig exploded. In 1999, Amoco, a corporation which had a nearly equally bad safety record, merged with BP. Obviously, when BP absorbed Amoco, it took on the same problems Amoco had been dealing with, while still facing all of the issues BP already had. In 2001, eleven workers were killed on a platform off the coast of Brazil. Four years later, BP’s Thunder Horse rig capsized in the Gulf. Before selling it, BP’s biggest refinery was in Texas City, Texas. When it exploded in 2005, fifteen workers died and more than 180 were injured. BP had committed over 300 safety violations and was fined $21.3 million. Investigators discovered that the accident could have been avoided with routine maintenance, but BP had been trying to

reduce costs and cut corners to the detriment of the company and the health of its employees.\textsuperscript{167}

It is easy to point fingers at the regulators for being ill-prepared and ill-equipped to handle such an important and technologically complicated task, but the training given to rig operators must also be considered.\textsuperscript{168} Offshore employees train on simulators, but they are insufficiently prepared for emergencies, considering all of the different systems aboard oil rigs and the different ways emergencies can occur.\textsuperscript{169} After the Texas City incident, BP instituted changes in order to improve the safety shortcomings that were part and parcel of the blast, such as making a single common management system that defined the safety rules and safety training for all refineries.\textsuperscript{170}

Later in 2009, BP was fined $87.7 million for committing 709 various violations in Texas City.\textsuperscript{171} BP was also forced to pay a $20 million criminal fine because of a poorly maintained Alaskan pipeline, which led to 300,000 gallons of crude oil spilling into Prudhoe Bay.\textsuperscript{172} This, too, was followed by a promise from BP to improve its ways, yet BP still lags behind other oil companies in safety requirements.\textsuperscript{173} A BP refinery in Toledo, Ohio was found to have made willful safety violations and fined $3 million.\textsuperscript{174} In total, BP committed 862 Occupational Safety and Health Association violations between 2007 and 2010, which made up ninety-seven percent of the total violations committed by the entire oil and gas industry in that time period.\textsuperscript{175} The commonality that existed after the government investigated each BP incident was a poor safety culture.\textsuperscript{176} BP is the biggest oil and gas producer in the nation, yet according to

\textsuperscript{168} See generally Brogdon, \textit{supra} note 4, at 325-26 (explaining how critics spend much less time discussing the training of rig workers compared to the time spent complaining about the failures on the part of regulators).

\textsuperscript{176} \textit{Id.} at 25.
RiskMetrics energy research, BP’s environmental, safety, and health records are worse than many of the major oil companies’ records.\textsuperscript{177}

There was no one single equipment, procedural, or human failure that gave rise to the Deepwater disaster.\textsuperscript{178} Following the spill, the U.S. House Committee on Energy and Commerce found “BP repeatedly chose risky procedures in order to reduce costs and save time and made minimal efforts to contain the added risk.”\textsuperscript{179} Even in 2010, after the numerous problems BP had encountered with spills, BP essentially assumed that there was little risk of a spill, and MMS took that at face value.\textsuperscript{180} Rebecca M. Bratspies believes that “MMS downplayed the risk of blowouts as negligible and easily addressed by modern technology.”\textsuperscript{181} To be fair, before Deepwater Horizon, this understanding was simply the standard; Conoco, Chevron, Shell, and Exxon filled out their lease applications with similar assumptions.\textsuperscript{182} All major oil companies were unprepared to respond to major spills.\textsuperscript{183} Even with the cleanup effort after the spill, BP used the same technology that had been deemed inadequate twenty years earlier during the cleanup of the Exxon Valdez spill.\textsuperscript{184}

One recommendation for how moratoria should be implemented in the future is that the government should only be able to implement a moratorium that applies solely to the tortfeasor. It is obvious from assessing the effects of Deepwater Horizon how detrimental a moratorium can be for an entire industry merely because of the mistakes of one company. In this particular case, BP was the sole tortfeasor, yet all the other offshore drilling companies suffered as a result of the six-month shut down, as well as the various economies that depended on offshore drilling.\textsuperscript{185} Should the government make sweeping decisions because of

\bibitem{179} Id. at 115, 125 (explaining how the committee found that the five contributing factors to the blowout were well design, centralizers, cement bond log, mud circulation, and lockdown sleeve, but BP’s investigative taskforce discovered eight breaches of protocol).
\bibitem{180} See Bratspies, supra note 1, at 46.
\bibitem{181} Id. at 44.
\bibitem{182} Id. at 46-47.
\bibitem{183} Id. at 47.
\bibitem{184} Id. at 49.
\bibitem{185} See Marzulla, supra note 7 (BP has seen its fair share of lawsuits stemming from the spill. One of the most important lawsuits is the December 15, 2010 lawsuit the DOJ filed against BP alleging gross negligence); Baudette & Gleason, supra note 56 (explaining how “the moratorium adversely affected all companies involved in deepwater drilling in the Gulf of Mexico”); see Latham,
the actions of one company? As Judge Feldman noted, “If some drilling equipment parts are flawed, is it rational to say all are? Are all airplanes a danger because one was? All oil tankers like Exxon Valdez?”\textsuperscript{186} Just because one company failed to follow correct protocol does not mean that all of the companies in the industry are likely to do the same. To avoid upsetting the economy in the future, the way moratoria are utilized and implemented should be scrutinized and altered, and holding the tortfeasor at fault by applying a moratorium only to the tortfeasor is one approach that could be adopted.

\addcontentsline{toc}{section}{B. A Compelling Reason and a Specific Goal}

A second recommendation concerning how and when moratoria should be issued is that the process of issuing a moratorium must be formalized. If the government refuses merely to put a halt to the operations of the company at fault for a disaster of this size, then there needs to be formalized rules concerning the underlying reasons behind a moratorium, as well as formalized rules concerning the length of time it can be effective. There are currently no rules or stipulations concerning the length of moratoria that the head of a government agency can request to be put into effect by the president; it is completely up to the president’s discretion.\textsuperscript{187} In a system in which so many other governmental actions are subject to the checks and balances of other entities, this is strikingly odd. Further, courts have already held that making a decision like this under the guise of an emergency action will not be deemed legitimate.\textsuperscript{188}

Since there is currently no set length for moratoria, then there is nothing in place that could prevent heads of agencies in the future from implementing moratoria that last even longer than six months. There is hardly any precedent for how long a normal moratorium ought to last, so this fact, coupled with a complete lack of rules and hardly any oversight, is a recipe for disaster.\textsuperscript{189} Legislation should be passed with a formal set of rules that must be followed if and when the head of a government agency recommends that a moratorium be issued. Two things that ought to be required are a compelling reason and a specific goal. Unless there is

\textsuperscript{supra} note 11, at 364 (explaining how it is unclear whether BP has enough money to compensate all the entities for damages which resulted from the spill, and it is clear that it was negligence on BP’s part).

\textsuperscript{186} See Thrasher, \textsuperscript{supra} note 51, at 1296.

\textsuperscript{187} See \textsuperscript{supra} text accompanying note 130.

\textsuperscript{188} See \textsuperscript{supra} text accompanying note 39; see \textsuperscript{supra} Part VI.

\textsuperscript{189} See Thrasher, \textsuperscript{supra} note 51, at 1312.
a compelling reason to issue one (and merely an emergency situation is not a compelling reason), with a stated specific goal, the government should refrain from issuing moratoria. Congress ought to provide agency heads with established rules concerning moratoria because currently there are none. Also, perhaps Congress could require that more people, besides the head of an agency and the president, be involved in the decision-making process to implement a moratorium.

C. Moratoria Should No Longer be Utilized to Temporarily Suspend the Actions of an Entire Industry

A third and final recommendation is that Congress should prevent the government from being able to issue moratoria altogether. This suggestion is simply that there should be no more industry-wide moratoria, possibly in any industry. The potential for economic chaos seems so much stronger than does the possibility of any improvement that could occur during a ban. Industry-wide improvements do not happen quickly; it is evident that essentially all of the offshore drilling improvements could have been made without a moratorium.190 Opponents of this recommendation may view it as hamstringing the power of federal agencies, but it is obvious that the current way agencies utilize moratoria is ineffective. Supporters of the post-Deepwater moratorium argued it “was necessary because the government simply could not risk the possibility of another spill,” yet there had not been any similar Gulf of Mexico blowouts since 1969; there was little reason to believe that another spill would happen anytime soon after Deepwater.191 Salazar felt as though he had to act quickly, “but the broad and dramatic oil-drilling moratorium, and its subsequent detrimental impact on the oil industry in the Gulf, illustrates the dangerous potential of reactive government regulation that forces innocent parties to bear a burden more rightly placed on others.”192 Broad sweeping solutions such as moratoria can rarely take full account of all the externalities that might be created, which causes collateral damage to both the industry and the economy.193

CONCLUSION

There is a problem with how easily and loosely moratoria are implemented. This article proposes three recommendations that could be implemented through legislative action to ensure that entire industries do not suffer because of a poorly proposed industry-wide ban. Heads of U.S. federal agencies should be more mindful of harmful outcomes that could result because of a rash ban, which will likely be lifted anyway. To this end, there must be legislation in this area. These moratoria need only apply to the tortfeasor; there needs to be a compelling reason for the moratorium with stated end goals, or federal agencies should simply lose the power entirely to issue a moratorium. Any of these three options is superior to the current state of moratoria implementation.

Blanket moratoria “paint with too large of a brush.”194 The government should be more intentional with its power to halt an entire industry. Shutting down an entire industry for six months is entirely too long, especially considering that multiple corporations were forced to file for bankruptcy as a result of the shutdown. Any mandatory pause placed on oil companies is not only bad for the oil companies, but more importantly, it is bad for the economy.195 Whether one company or multiple companies are to blame for a catastrophic environmental breach, it is in the United States’ best interest for the government not to be able to shut down an entire industry for any period of time, while in the interim giving rise to bankruptcies and widespread economic hardship. The ability to implement moratoria is a powerful and potentially deleterious government function, and it should not be used to harm any industry, especially an industry that is so vital to the American economy.
